HighlightS

The present report is based on the 5th Land Holdings Survey of NSSO carried out in its 48th round during January to December 1992. The survey has covered 34,799 *operational holdings* spread over 4231 villages and 4220 urban blocks. The survey results presented in the report pertain to the agricultural year 1991-92. Some of the important findings are given below.

O_{perational} H_{oldings} :

- There were over 103 million *operational holdings* in the country, of which more than 90% was operated by residents of rural areas.
- The total *operated area* was estimated at 131 million hectares, more than 95% of which was operated by the rural households. The total *operated area* in rural areas (125 million ha.) has remained largely unchanged during the 1970s and 1980s. The *net sown area* accounted for 93% of the total *operated area* in 1991-92.
- At the national level, average size of an *operational holding* was 1.34 hectare in the rural sector and 0.61 hectare in the urban sector. The average size of rural holdings has declined by 50% between 1960-61 and 1991-92. The number of fragments per holding was 2.7.
- The number of *operational holdings* in rural areas has grown by about 80% since 1960-61. During 1981-91 the percentage rise in the number of *operational holdings* was 31.5%.

S_{ize} D_{istribution} :

- Generally speaking, notwithstanding the progressively downward shift in the distribution, the highly skewed nature of the size distribution of operational holdings has remained unchanged over the last three decades. However, during the last two decades the Gini's coefficient (a measure of inequality) of the size distribution has risen from 0.586 to 0.641.
- During the last three decades, the number of *marginal* holdings has trebled, from 19.8 million in 1960-61 to 58.7 million in 1991-92. As against this, the absolute numbers of *large* and *medium* holdings have declined steadily during this period.
- The percentage share of *operated area* under *marginal* holdings has increased from 7% to 16% during these three decades.

T_{enancy} :

--

- The present survey suggests a reversal of the trend towards a decline in the incidence of tenancy that was evident between 1960-61 and 1981-82. The total *leased-in operated area*, which had declined from 14 million hectares in 1960-61 to 9 million hectares in 1981-82, rose to 10.5 million hectares during the eighties.
- The rise in the total *leased-in operated area* is mostly accounted for by a sharp rise in the total *leased-in area* in the *large* holdings. This was accompanied by a significant rise, both in terms of percentage share and the total *leased in area*, in tenancy under *fixed rent* terms. However, area under *share cropping* has remained stable during the 1980s.

Use :

- About 80% of the *operational holdings* were used mainly for crop production, while 10% were mainly used for rearing livestock. As in 1981-82, livestock rearing was the main use of 42% of the holdings of Punjab in 1991-92.
- In 1991-92, 35% of the *operated area* in rural areas was *irrigated*. *Tubewells* (36%) and *canals* (26%) were the two most important sources of irrigation at the national level. In Punjab and Haryana, 73% of the *operated area* was *irrigated* during 1991-92. In sharp contrast, only 6% of the *operated area* in Assam was *irrigated* during the year.

Chapter 1

Introduction

1.1.0 The survey on Land and Livestock Holdings carried out in the forty-eighth round (January-December 1992) of the National Sample Survey Organization (NSSO) is the fifth in the series of similar surveys conducted so far by the NSSO. The objective of these surveys has been to generate the basic quantitative information on the agrarian structure of the country, which is relevant to land policy. A large part of the information is collected mainly along the lines suggested in World Agricultural Census Programme of the Food and Agricultural Organisation (FAO) and thus serves the purpose of international comparison as well.

1.1.1 The present report is the second of the series of four reports to be brought out on the land and livestock holdings survey. This report covers various features of household operational holdings and presents estimates on utilisation, tenurial form and size distribution of operational holdings.

1.2 Background

1.2.0 The first survey on land holdings was taken up by the NSS in its

eight round (July '54-April '55) as part of the World Agricultural Census initiated by the Food & Agricultural Organisation (FAO) of the United Nations. In this survey, information on (agricultural) holdings was collected mainly to meet the requirements of the FAO. In addition, information on household ownership holdings was collected to provide the policy framers with the much needed data for formulating land reforms policy for the country. A similar survey was conducted again in the sixteenth (July '60 - August '61) and seventeenth (September '61 - July '62) rounds of the NSS as a part of the World Agricultural Census Programme of 1960.

1.2.1 Since then, NSSO has been regularly conducting Land Holdings survey every ten years. The third Land Holdings survey, conducted in its twenty-sixth round (July '71 - June '72), was integrated with a survey on Debt and Investment at the instance of the Reserve Bank of India. The present enquiry, as well as the fourth survey of the series conducted in the thirty-seventh round (January - December '82), essentially repeat the twenty-sixth round survey with some modifications in item coverage and the method of data collection.

1.3 Scope

1.3.0 In the Land and Livestock Holdings survey of the NSSO, two types of holdings, namely, household ownership holdings and operational holdings, are enumerated by interviewing the sample households. Data are collected on the size (in terms of area), type, utilisation, tenurial status and other related aspects of both types of holdings.

1.3.1 *Items of enquiry:* In the 48th round, information on various aspects of ownership and operational holdings was collected for both rural and urban areas. Particulars of land owned, land leased out, types and terms of lease formed the main body of information for the study of ownership holdings. Further, particulars of land leased in were also collected to ascertain the land possessed by the households. For the operational holdings, data on size, composition, tenurial form, land use, extent of irrigation by source, fragmentation of holding, drainage facilities and other related aspects of holdings were collected. Since livestock and agricultural machinery form the basic resources for agricultural operations, an inventory of these assets owned by the households on the date of survey was also obtained.

1.3.2 *Geographical coverage :* The forty-eighth round was planned to cover the whole of Indian Union excepting

- (i) Ladakh and Kargil districts of Jammu & Kashmir;

- (ii) 768 interior villages of Nagaland (out of a total of 1119 villages) located beyond 5 kms. of a bus route,

- (iii) 172 villages in Andaman & Nicobar Islands (out of a total of 520 villages) which are inaccessible throughout the year.

However, the survey could not be conducted in six districts of Jammu & Kashmir viz., Anantnag, Pulwana, Srinagar, Badgam, Baramula and Kupwara, and in the district of Amritsar in Punjab due to unfavourable field conditions.

1.4 Method of Data Collection

1.4.0. The information for Land and Livestock holdings survey was collected from a sample of households by interview method. Each sample household was visited twice during the period of survey with a gap of four to eight months. Two different schedules of enquiry were canvassed in the two visits.

1.4.1 *Survey period :* The survey period for the forty-eighth round survey was the calendar year 1992. In order to reduce recall error, particulars relating to the entire agricultural year were collected by visiting each sample household twice during the survey period. The first visits to the sample households were made during January to August, while the second visits were made during

September to December. The longer period for the first visit reflected the higher workload for the field staff during this visit compared to the second visit.

1.4.2 *Reference period:* The information on holdings operated during the *Kharif* season of the agricultural year 1991-92 was collected in first visit, while that on holdings operated during the *Rabi* season was collected in the second visit. In addition, particulars of operational holdings with the agricultural year 1991-92 as the reference period were also collected in the second visit. The present report is based on the data of operational holdings with agricultural year as the reference period.

1.4.3 *Sample design :* The sample design adopted for the survey was essentially a stratified two stage design, with census villages and urban blocks as first stage units (FSUs) for the rural and urban sectors respectively, and households as the second stage sampling units (SSUs) in both the sectors. The selection of villages was done with probability proportional to population (with replacement), mainly based on the 1981 census list of villages. The selection of urban blocks was done with equal probability without replacement based on Urban Frame Survey (UFS) conducted by the NSSO as an on-going activity. The details of sample design and estimation procedure adopted for the survey are given in Chapter 2 of this report.

1.4.4 *Sample size - first stage units :* In all 9052 villages were planned to be

surveyed in this round. Of these, 4328 villages were allocated to the central sample - the part surveyed mainly by the NSSO field staff - and the rest to the state sample - the part surveyed by the state agencies. In the urban sector, the allocations for the central and state samples were 2484 and 3076 blocks respectively. This report is based on the estimates obtained from the central sample alone. The number of villages and urban blocks actually surveyed under the central sample was 4231 and 2420 respectively.

1.4.5 *Sample size - second stage units :* Our plan was to survey 8 households from each sample village and 9 households from each sample urban block. In the central sample, the actual number of households surveyed was 33289 in the rural sector and 20592 in the urban sector.

1.5 Concepts and definitions

1.5.0 Major concepts and definitions of important terms used in the survey and relevant to this report are explained below :

1.5.1 *Household :* A household is a group of persons normally living together and taking food from a common kitchen. However, a boarding house, a hotel or a hostel was treated as a cluster of households, where each individual boarder formed a separate household. If, however, some of persons among them normally pooled their income for spending, the group was treated as forming a single household. Barracks of military and paramilitary forces,

orphanages and vagrant-houses were excluded from the scope of the survey.

1.5.2 *Operational holdings:* An operational holding is defined as a techno-economic unit used wholly or partly for agricultural production (defined below) and operated (directed/managed) by one person alone or with the assistance of others, without regard to title, size or location. The holding might consist of one or more parcels of land, provided they are located within the country and form part of the same technical unit. In the context of agricultural operations, a technical unit is a unit with more or less independent technical resources covering items like land, agricultural equipments and machinery, draught animals etc. Holdings used exclusively for livestock and poultry raising and for production of livestock and poultry products (primary) and/or pisciculture are considered as operational holdings whereas holdings put exclusively to uses other than agricultural production are not considered as operational holdings. Holdings operated by cooperative farms are also not considered as operational holdings.

1.5.3 *Agricultural production:* The extended definition of agricultural production, as adopted in the survey, includes growing of field crops, fruits, grapes, nuts, seeds, tree nurseries (except those of forest trees), bulbs, vegetables and flowers both in the open and in glass houses ; production of coffee, tea, cocoa, rubber, forest production in parcels of land which form part of the enumeration holding and production of livestock and livestock products,

poultry and poultry products, fish, honey, rabbits, fur-bearing animals, and silk-worm cocoons.

1.5.4 *Individual and joint holdings:* An operational holding managed by the members of a single household is taken as an individual holding and a holding managed by members of different households jointly is considered a joint holding.

1.5.5 *Parcel:* A parcel of an operational holding is a piece of land entirely surrounded by other operational holdings or by land not forming part of any operational holding. It might consist of one or more plots.

1.5.6 *Ownership of land :* (i) A plot of land was considered to be owned by a household if permanent heritable possession, with or without the right to transfer the title was vested in a member or members of the household. Land held in owner-like possession under long term lease or assignment was also considered as land owned. Thus, in determining the ownership of a plot of land two basic concepts were involved, namely,

- (a) Land owned by the household, i.e. land on which the household had the right of permanent heritable possession with or without the right to transfer the title, e.g. Pattadars, Bhumidars, Jenmons, Bhumi-swamis, Rayat Sithibans, etc. A plot of land may be leased out to others by the owner without losing the right of permanent heritable possession.

(b) Land held under special conditions such that the holder did not possess the title of ownership but the right for long term possession of the land (for example, land possessed under perpetual lease, hereditary tenure and long term lease for 30 years or more) was considered as being held under owner-like possession. In states where land reform legislation has provided for full proprietorship to erstwhile tenants, they were considered as having owner-like possession, even if they had not paid the full compensation.

(ii) Sometimes a plot may be possessed by a tribal in accordance with traditional tribal rights from local chieftains or village/district council. Again, a plot may be occupied by a tenant while the right of ownership vests in the community. In both the cases, the tribal or the other individual (tenant) was taken as owner, for in all such cases, the holder had the owner like possession of land in question.

1.5.7 *Lease of land* : (i) Land given to others on rent or free by owner of the land without surrendering the right of permanent heritable title is defined as land leased out. It is defined as land leased in if it is taken by a household on rent or free without any right of permanent or heritable possession. The lease contract may be written or oral.

(ii) Sometimes orchards and plantations are given to others for harvesting the produce for which the owner receives a payment in cash or kind. Such transactions were not treated as 'lease' for the purpose of the survey.

1.5.8 *Otherwise possessed land* : This was understood to mean all public/institutional land possessed by the household without title of ownership or occupancy right. The possession was without the consent of the owner. Private land (i.e. land owned by the household sector) possessed by a household without title of ownership and occupancy right was not included in this category. As in the 37th Round survey, all private land encroached upon by the household was treated as leased-in land.

1.5.9 *Homestead land* : (i) Homestead of a household was defined as the dwelling house of the household together with the courtyard, compound, garden, out-house, place of worship, family graveyard, guest house, shop, workshop and offices for running household enterprises, tanks, wells, latrines, drains and boundary walls annexed to the dwelling house. All land coming under homestead was defined as homestead land.

(ii) Homestead may constitute only a part of a plot. Sometimes, gardens, orchards or plantations, though adjacent to the homestead and lying within the boundary walls, may be located on a clearly distinct piece of land. In such cases, land under garden, orchard or plantation was not considered as homestead land.

1.5.10 *Land utilisation in the holdings* : The classification of land used for this report is based on the utilisation of the land during the agricultural year. The definitions of various classes of land relevant for the report are given below :

(1) **FOREST** : This includes all area actually under forest or land so classed under any legal enactment or administered as forest, whether state owned or private. If any portion of such land is not actually wooded but is used for raising of field crops, it is treated under net sown area and not under forest. All plots of land under social and farm forestry were included in this class.

(2) **ORCHARDS** : A piece of land put to production of horticulture crops, viz., fruits, nuts, dates, grapes etc. (other than those treated as plantation crops), is regarded as an orchard, if it is at least 0.10 hectare in size or has at least 12 trees planted on it. In the case of such fruit trees where distance between the trees was quite large, say more than six metres, as in the case mangoes, the orchard is defined according to the minimum number of 12 trees planted in it. In cases where the distance was less than six metres as in the case of bananas, papayas, grape vines etc., the orchard is defined on the basis of the minimum area of 1/10th of a hectare.

(3) **PLANTATIONS** : Area devoted to production of plantation crops, viz., tea, coffee, cashew nut, pepper, coconut, cardamom, rubber, cocoa, arecanut, oil palm, clove and nutmeg, is treated as area under plantation. The size restriction given for orchards is also applicable for plantations.

(4) **AREA UNDER SEASONAL CROP** : All land under net sown area not coming under orchards or plantations is taken as area under seasonal crops. Sometimes, net sown area consists of a piece of land put to a combination of the

above three uses. In such cases, the use to which the major area of the piece of land is put is treated as the 'use' of the piece of land.

(5) **LAND PUT TO NON-AGRICULTURAL USES** : This includes all land occupied by buildings, path etc. or under water (tanks, wells, canals etc.) and land put to uses other than agricultural uses. For the purpose of this survey, this class of land was further divided into two classes :

(a) **WATER BODIES** : All land which is perennially under water is defined as water bodies, provided that no crop was raised on them.

(b) **OTHER NONAGRICULTURAL USES** : All land put to other non-agricultural uses, viz., buildings, roads, railways, paths etc. is classified as land put to other non-agricultural uses.

(6) **OTHER USES** : This includes all land coming under rest of the classes of standard nine-fold classification, viz., "culturable waste", "miscellaneous tree crops and groves not included in net sown area", "permanent pastures and other grazing land" and "barren and unculturable waste".

1.5.11 *Irrigation* : Irrigation was considered as a device of purposively providing land with water, other than rain water, by artificial means for crop production.

1.5.12 *Terms of lease*: The various terms of lease on which the area was leased out to the lessee households were :

- (1) for fixed money
- (2) for fixed produce
- (3) for share of produce
- (4) for service contract
- (5) for share of produce together with other terms
- (6) under usufructuary mortgage
- (7) from relatives under no specified terms and
- (8) under other terms.

It may be noted here that leasehold under crop-sharing basis meant that the owner of land received a stipulated share of the produce but he did not participate in the work nor did he manage or direct or organise the agricultural operations on the plot of land which he had leased out. Leasehold under service contract

meant that an employer gave some land to an employee for cultivation in lieu of the services provided by him on the condition that the land could be retained so long as the employee continued to serve the employer and no other specific terms of lease was contracted. The contracts by which the mortgagor retained the ownership of land till the foreclosure of the deed but the possession of the land was transferred to the mortgagee would be considered as lease of land under usufructuary mortgage. Sometimes land owned by a household is looked after and used by a close relative. For example, a person staying away from his village may own a piece of land in the village which is looked after and used by his brother's household. All such land possessed by the household operating a holding but owned by some relative's household under no contract of payment of any kind to the owner, was treated as leased in from 'relatives under no specified terms'. Lease on terms other than those specified for types (1) to (7) stated above was treated as 'under other terms'. All rent free leases, other than from 'relatives under no specified terms', were treated as leases 'under other terms'.

1.6 Contents of the Report

1.6.1 This report contains three chapters, including the present introductory chapter, and an appendix. Chapter 2 gives a fairly detailed description of the sample design and estimation procedure used for the survey. Chapter 3 discusses the principal findings obtained from the survey on operational holdings. Appendix forms the main body of the report. It gives the results in detail for the operational holdings.

1.6.2 The estimates presented in this

report are based on the pooled data of the two sub-samples of only the central sample. Only in Table (1R/1U) of Appendix , estimates from the two sub-samples are given for the two basic characteristics, namely, number of operational holdings and area operated.

1.6.3 The results presented in the report are mostly in form of ratios (like percentage, average etc.). The basic aggregate estimates for the number of operational holdings and area operated provided in Table (1) of Appendix , may be used for arriving at aggregate estimates of other characteristics.

Chapter 2

Sample Design and Estimation Procedure

2.1 SAMPLE DESIGN

2.1.0 Sample Design: A stratified two-stage sampling design was adopted for the survey with the first stage units as census villages for rural areas and the Urban Frame Survey blocks for urban areas. Households formed the second stage units in both rural and urban areas.

2.2.0 Sampling frame for first stage units (FSU's): In the rural sector, the sampling frame in most of the strata was the 1981 census list of villages. However, in Assam, where the 1981 census was not undertaken, and in a few districts of other states, where the available list as per 1981 census was incomplete, the 1971 census list of villages was used. In the urban sector, the sampling frames used in most cases were the lists of NSS Urban Frame Survey (UFS) blocks. However, the 1991 census house listing enumeration blocks were considered as the sampling units for some of the new towns declared as urban areas in the 1991 population census.

2.3.0 Stratification : Each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with

respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the India as whole was 78.

2.3.1 In the rural sector, within each region, each district with a rural population of less than 1.8 million according to the 1981 census formed a single basic stratum. Districts with larger population were divided into two or more strata, depending on population, by grouping contiguous tehsils, similar as far as possible in respect of rural population density and crop pattern. In Gujarat, however, in the case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million. Further, in Assam, the strata formed for the earlier NSS rounds on the basis of 1971 census rural population exactly in the above manner, but with a cut-off of 1.5 million population, were retained as the strata for rural sampling.

2.3.2 In the urban sector, strata were formed again within NSS regions, on the

basis of 1981 (1991 in some of the new towns) census population of towns. Each city with a population 10 lakhs or more formed a separate stratum by itself. The remaining towns of each region were grouped to form three different strata on the basis of 1981 (1991 in a few cases) census population. The strata were formed as details stated below :

Composition of Urban Strata :

stratum no.	population size class of towns
1	all towns with population less than 50,000
2	all towns with population 50,000 to 1,99,999
3	all towns with population 2,00,000 to 9,99,999
4	all towns with population 1 million and above

2.4.0 *Allocation of sample* : A total all-India sample of 6812 first stage units (4328 villages and 2484 urban blocks) - determined on the basis of investigator strength in different states/u.t.'s and the expected workload per investigator - was initially allocated to the states/u.t.'s in proportion to central field staff available. The sample thus obtained for each state/u.t. was then allocated to its rural and urban sectors considering the relative sizes of the rural and urban population, with almost double weightage being given for the urban sector. Within each sector of

state/u.t., the allotted sample size was re-allocated to the different strata in proportion to the stratum population. All allocations were adjusted so that the sample size for a stratum was at least a multiple of 4 for the rural and urban sectors separately. This was done to accomplish equal-sized samples in each sub-sample and sub-round. The only exception was Daman & Diu for which the first stage rural sample comprised 2 villages only.

2.5.0 *Selection of first stage units* : The selection of sample villages was PPS (with replacement) with population as the size variable, in the form of two independent sub-samples. The sample blocks were selected by simple random sampling without replacement, also in the form of two independent sub-samples.

2.5.1 *Arunachal Pradesh* : For the rural areas of Arunachal Pradesh, a cluster sampling procedure was followed. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages, each cluster being formed around a nucleus village, according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

2.6.0 *Selection of hamlet-groups/sub-blocks* : Large villages and blocks were divided into a suitable number of hamlet-groups and sub-blocks respectively having more or less equal population content. Two hamlet-groups were then selected from large villages, whereas only one sub-block was selected from the large blocks. The hamlet-groups were selected circular systematically and the sub-block with equal probability.

2.7.0 *Selection of households* : Two different procedures of selection of households were used for the rural and urban sectors. Different procedures for the two sectors were necessary, since in the rural sector schedules of enquiry for LLH survey and Debt & Investment survey were required to be canvassed in two separate sets of sample households, while in the urban sector, both the schedules were to be canvassed in the same set of sample households.

2.7.1 In the rural sector, eight households were selected from each sample village/selected hamlet groups. For selecting a sample of 8 households, first, all the households of the sample village/selected hamlet groups were divided into four sub-strata by area of land possessed by them. Households possessing either no land or land less than .005 acre were grouped in sub-stratum 1. The rest of the households were then arranged in ascending order by area of land possessed and classified into three sub-strata, 2, 3 and 4, such that the total area of land possessed by the households in each of the 3 sub-strata was nearly the same. Independent samples of size 1,3,2 and 2 households were selected circular systematically from the

sub-strata 1, 2, 3 and 4 respectively.

2.7.2 In the urban sector, a sample of 9 households were selected from each sample urban block/sub-block. The households of a sample block/sub-block were classified into 7 strata, considering the monthly per capita consumption expenditure (mpce) and indebtedness status of the households. For this, the households were first grouped in three mpce classes, viz., less than A, A to B and B & above. The cut-off points A and B were determined at the state-level on the basis of mpce obtained from the survey on consumer expenditure, NSS 43rd Round, such that the mpce classes, below A, A to B, and B and above, respectively constituted 30 p.c, 60 p.c, and 10 p.c. of the urban population of the state. These mpce classes were further sub-divided by indebtedness status of the households to form 7 sub-strata. A sample of size 1 or 2 was selected from each sub-strata. For the sub-strata with allocation of 2 sample households, the samples were drawn circular systematically.

2.8.0 *Sample size* : In all, the survey covered 53881 households spread over 6651 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households surveyed, are given for different state/u.t.'s and all-India in the statement given below, separately for rural and urban sectors.

ESTIMATION PROCEDURE :

2.9.0 The estimation procedure adopted in the 48th round for schedule 18.1 is briefly indicated here.

2.10.0 *Notations* : The notations used for describing the estimation procedure are given below :

- s : subscript for sth stratum
- i : subscript for ith village/block
- t : subscript for tth sub-stratum (i.e. household-strata within a village/block)
- j : subscript for jth sample household
- L : total number of rural/urban strata in the state
- p : village population (used for sampling and as per frame)
- P : total population of a rural stratum (as per frame)
- N : total number of blocks in an urban stratum as per frame. This notation is also used for total number of villages in a rural stratum of Arunachal Pradesh as per frame
- n : number surveyed villages/blocks including depopulated and zero cases available for tabulation (excluding casualty and other not received cases)
- C : number of census villages in a surveyed revenue village
- D : number of hamlet-groups/sub-blocks formed
- H : total number of households in the frame
- h : number of surveyed households (available for tabulation) in a sub-stratum

x , y : values of characteristics of an operational holding of the sampled household
X or Y : total of x or y at the state level

\bar{y} : estimate of Y from the sample for rural sector
 $D' = D$ if $D=1$
 $=D/2$ if $D \geq 4$

k : number of partner households of a joint operational holding
For individual holding , k=1.

Comment:

2.11.0 *Estimates of aggregates* : As sampling procedures were different for the rural and the urban sectors, the estimation formulae used for the two sectors were also different.

2.11.1 *Rural* : For the states and u.t.s, other than Arunachal Pradesh and Lakshadweep, the estimates for the aggregate for the sth stratum is given by

$$\bar{y}_s = \frac{P_s}{n_s} \sum_{i=1}^{n_s} \frac{D'_{si}}{C_{si}} \frac{1}{p_{si}} \sum_{t=1}^4 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} \frac{y_{sitj}}{k_{sitj}}$$

For Arunachal Pradesh ,

$$\bar{y}_s = \frac{N_s}{n_s} \sum_{i=1}^{n_s} \sum_{t=1}^4 \sum_{j=1}^{h_{sit}} \frac{H_{sit}}{h_{sit}} \frac{y_{sitj}}{k_{sitj}}$$

and for Lakshadweep

$$\bar{y}_s = \frac{7}{n_s} \sum_{i=1}^{n_s} \frac{D'_{si}}{C_{si}} \sum_{t=1}^4 \sum_{j=1}^{h_{sit}} \frac{H_{sit}}{h_{sit}} \frac{y_{sitj}}{k_{sitj}}$$

2.11.2 *Urban* : For all the states, the estimate of aggregate of the s^{th} stratum is given by

$$\bar{y}_s = \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{t=1}^7 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} \frac{y_{sitj}}{k_{sitj}}$$

2.11.3 *State/u.t. level estimates* : The aggregate estimates at the state /u.t. levels were worked out separately for the rural and urban sectors. For both the sectors, the aggregate estimate at the state/u.t. level was obtained as

$$\bar{y} = \sum_{s=1}^L \bar{y}_s$$

2.11.4 *Subsample estimates* : Each subsample estimate was based on the data collected from the surveyed FSUs of the respective subsample. For each state/u.t. (or national level estimate) 2 subsample estimates were obtained separately for the rural and urban sectors. The formulae given above were

used for this purpose, taking n_s as the number of surveyed FSUs of the respective subsample.

2.11.5 *Combined estimate* : The 'combined' estimates for the rural urban sectors of a state/u.t. (or national level estimate) were obtained as the simple averages of the subsamplewise estimates for the respective sectors. All the estimates presented in this report are based on the combined estimates of the aggregates, unless otherwise specified.

2.12.0 *Estimates of ratios* : Let X and Y be the respective totals of two characteristics X and Y at the state/u.t./ national level. Thus the estimate of ratio $R = Y/X$ is obtained as

$$\bar{R} = \frac{\bar{Y}}{\bar{X}} \quad \text{where } \bar{X}$$

and \bar{Y} are the estimates of X and Y respectively. Both the subsample and the combined estimates of ratios were obtained in this way.

Table (2.1) : Number of sample villages and urban blocks allotted and surveyed and number of households surveyed

* 18 nucleus villages were allotted for Arunachal Pradesh(rural). The original allocation showed 72 villages for Arunachal Pradesh; this was done on the basis of 4 villages per nucleus villages. However, the number of villages surveyed actually turned out to be 89.

Chapter 3

Summary of findings

3.0 The Land Holdings Survey (LHS) of NSS is one of the main sources of information on ownership of land and agriculturally operated land in the country. It provides estimates of two basic distributions of land holdings, viz., distribution of land owned by households and that of land operated. Information on household ownership of land was presented in the first report on Land and Livestock Holdings Survey of the 48th round (NSS Report No.399). The present report gives the survey results relating to techno-economic units called *operational holdings*.

3.0.1 The major findings of the enquiry on operational holdings are summarised in this chapter. To start with, the discussion traces the changing aspects of operational holdings and their size-distribution over the last three decades. The nature and extent of tenancy are then presented in some detail. Finally, the survey results on the use of land holdings are discussed in terms of agricultural operations carried out in them.

3.1 Estimates of operational holdings: all-India

3.1.1 An operational holding is defined as a techno-economic unit used wholly or partly for agricultural production and is operated (directed or managed) by one

person alone, or with the assistance of others without regard to the title, size or location.

3.1.2 As distinct from a *household ownership holding*, which is restricted to the area of land owned by a household, *operational holding* encompasses all land under physical possession of the techno-economic unit either owned, leased in or otherwise possessed. A unit with more or less independent technical resources for agricultural operations like land, agricultural equipment and machinery, draught animals etc. was considered to be an operational holding if some agricultural production was carried out on any part of the land under its possession during the reference period. In the present survey, the agricultural year 1991-92 was used as the reference period.

3.1.3 Area under operational holdings is called operated area. For the present survey, the area possessed by an operational holding for the major part of the agricultural year 1991-92 was taken as its operated area.

3.1.4 Table 3.1 shows that there were over 103 million operational holdings in the country during the agricultural year 1991-92. Of these, more than 90% were operated by residents of rural areas. The total operated area was estimated at 131 million hectares (mha.), with only about

5% of it operated by the urban residents. The average size of an operational holding was 1.34 ha. for the rural sector and 0.61 ha. for the urban sector.

Table 3.1
Number of operational holdings and area operated: 1991-92

item	INDIA	
	rural	urban
1. No. of operational holdings (mill.)	93.45 (90.2%)	10.11 (9.8%)
2. Area operated (mill. ha.)	125.10 (95.3%)	6.15 (4.7%)
3. Area operated per holding (ha.)	1.34	0.61
4. No. of households (mill)	116.41	41.80

The estimates of item 4 are taken from NSS Report No. 399

3.1.5 The remaining part of this chapter will be concerned with the rural sector only.

TRENDS IN OPERATIONAL HOLDINGS

3.2.1 Data on operational holdings are being collected regularly by the NSSO since its eighth round (1954-55). So far, five land holding surveys, including the present one, have been conducted. The results of these surveys form a useful series of data spanning a long period of time. The estimates of different rounds are on the whole comparable, except for those of the 8th round, which, due to differences in definitions, are not strictly

comparable with the other rounds and are therefore omitted from the discussion which follows.¹

3.2.2 The definition of operational holdings has undergone only a marginal change since the 17th round (1960-61) with respect to the coverage of "operated land". In the 37th round (1981-82), the definition of operated land was extended to include land encroached or occupied on squatter basis, which is referred to as "otherwise possessed" land in this report. It is seen from Table 3.2 that the percentage shares of such land in the operated area were only 1.7% and 1.0% in 1981-82 and 1991-92 respectively. This means the results of the four surveys since the 17th round remain comparable in spite of the change in definition.

3.2.3 There is, however, a problem of comparison in respect of reference period. In the 17th, 26th and 48th rounds, the criterion used for recognizing an operational holding was "any agricultural production during the reference agricultural year". The estimates of these rounds were obtained directly from the data collected for the entire agricultural year. In contrast, the estimates of the 37th round were generated on the basis of data collected for the major crop season of the reference agricultural year, which means no account was taken of holdings which had carried out agricultural production only during the minor crop season.

¹ See Bibliographical Note 1.

Table 3.2
Estimates of certain key characteristics of operational holdings in rural India from Land Holding Surveys of NSS: 1960-61 to 1991-92

item	1960-61 (17th)	1970-71 (26th)	1981-82 (37th)	1991-92 (48th)
1. Number of operational holdings (mill.)	50.77	57.07	71.04	93.45
1.1 percentage increase	--	12.4%	24.5%	31.5%
2. Area operated (mha.)	133.48	125.68	118.57	125.10
3. Average area operated (ha.)	2.63	2.20	1.67	1.34
4. Percentage of joint holdings	4.22	0.60	0.62	0.08
5. Number parcels per holding	5.7	n.a.	4.0	2.7
6. <i>percentage of operational holdings with partly or wholly</i>				
(a) owned land	94.86	95.64	92.91	96.15
(b) leased-in land	23.52	24.68	15.20	10.99
7. <i>In area operated, p.c. share of</i>				
(a) area owned	89.30	89.43	91.08	90.44
(b) area leased in	10.70	10.57	7.18	8.52
(c) area otherwise possessed	--	--	1.74	1.04
8. No. of sample villages	3,486	4,547	3,692	4,231
9. No. of sample households	53,138	35,947	29,089	33,289

1. Sources of estimates of 17th, 26th and 37th rounds : NSS Report Nos. . 144, 215 & 331

2. Estimates for item 7 are based only on area reporting the type of possession

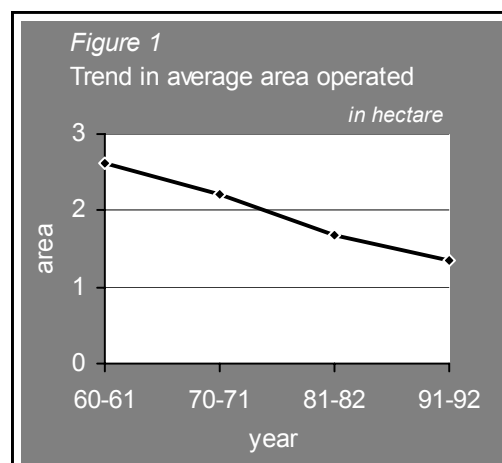

3.2.4 Table 3.2 gives the basic estimates relating to operational holdings of the last four Land Holding Surveys (LHS) of NSS. The sizes of the samples (at both the stages) on which the estimates are based are also shown in the table.

3.2.5 *Rise in the number of operational holdings* : The number of operational holdings has increased rapidly from 51 million in 1960-61 to 93 million in

1991-92. Also, the rate of growth of operational holdings has accelerated over the three decades (*see item 1.1 of Table 3.2*). The growing population, and the inability of the non-agricultural sector to absorb additional work force have led to unabated subdivision of operational holdings. As a result, the number of operational holdings has grown by about 80% within a span of three decades. The virtual

disappearance of joint holdings also has made some contribution to the rise in the number of operational holdings. There were over 4% joint holdings, i.e. holdings operated jointly by members of two or more households, in 1960-61. By 1970-71 the proportion of joint holdings had come down to a tiny fraction (0.6%). During 1991-92, nearly all the operational holdings were managed by individual households and only a negligible proportion of them were operated jointly by more than one household.

3.2.6 Change in area operated : The total operated area of 133 mha. in 1960-61 had dropped to 126 mha. in 1970-71 -- a fall of about 8%. The estimates of the 26th round and the present survey (125 mha.) reveal little change in operated area during the last two decades. The estimate of the 37th round, however, is significantly smaller than that for the 48th round. This is despite the fact (*see Chapter 1 paragraph 1.3.2*) that a large part of Jammu & Kashmir and a large district of Punjab could not be covered by the 48th round due to unavoidable circumstances, whereas the entire sample was surveyed in the 37th round as per the planned coverage. In fact, the fall during the seventies, shown by the estimates in Table 3.3.2, owes more to the reference period employed for estimation of area in the 37th round than to actual change in area operated. Bearing this in mind, it can be reasonably concluded that total operated area in the rural sector has remained largely unchanged during the seventies and eighties.

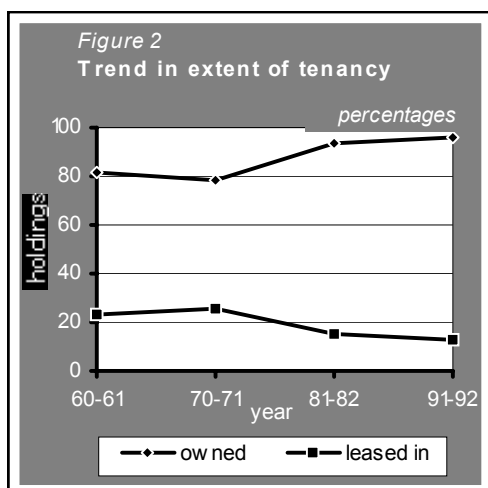

3.2.7 Declining size of holdings : The consequence of rapid growth in the number of operational holdings with a limited land base is clearly shown by the estimates of average area operated per holding given in Table 3.3.2. Over the three decades, the average size of a holding has nearly halved from 2.63 ha. in 1960-61 to 1.34 ha. in 1991-92 (Figure 1).

3.2.8 Number of parcels per holding: Fragmented holding has been a chronic problem in Indian agriculture. The estimates available from three LHS's show that the number of parcels per holding has decreased from 5.7 in 1960-61 to 2.7 in 1991-92.

3.2.9 Trends in tenancy of land by operational holdings: During the thirty years beginning with 1960-61, land tenure status of operational holdings has undergone significant changes. Table 3.2 reveals that the percentage of holdings with partly or wholly owned operated area increased steadily from 82% in 1960-61 to 96% in 1991-92, whereas that of holdings operating on partly or wholly leased in land (henceforth called 'tenant holdings') declined sharply from 24% to 11% during the same period.

This trend, indicating a continuous shift from tenant cultivation to self cultivation, has been a characteristic feature of Indian agriculture in the post-Independence period.

3.2.9 The extent of tenancy measured in terms of percentage share of area leased in reveals (*see item 7 of Table 3.2*) a similar trend during 1960-61 to 1981-82. The share of leased-in land in operated area came down to 7% in 1981-82 from 11% in 1960-61. Over the last decade, however, there has been a rise, instead of a fall, in this share (Table 3.2). A more detailed discussion on tenancy is contained in Section 3.5.

3.3 Size distribution of operational holdings : all India

3.3.1 Any significant change in agrarian structure should have some impact on the size distribution of land holdings. In this section, various aspects of this distribution are examined to see whether any such structural change is indicated. In the detailed tables given in the

Appendix, two different size classifications have been used for presentation of the tables -- one based on 15 size classes and the other on 8 broader classes. The latter are referred to as "broad size classes" and the former as simply "size classes". Here, in order to study the change in size distribution, the "broad size classes" are further merged to form five size-classes along the lines adopted in the Agricultural Census of India. The 5 size groups are as follows:

marginal	: less than 1.01 ha.
small	: 1.01 - 2.00 ha.
semi-medium	: 2.01 - 4.00 ha.
medium	: 4.01 - 10.00 ha.
large	: larger than 10.00 ha.

These size groups will henceforth be called *categories* of operational holdings.

3.3.2 *Marginalisation of holdings*: A general feature of size distribution of operational holdings is that the percentage of holdings decreases as the holding size increases. The percentage distributions of operational holdings given in Table 3.3 reveal that the decline is getting progressively steeper with each decade. The percentages of large, medium and semi-medium holdings have been declining steadily since 1960-61. The decline is steepest for large holdings from 4.5% to 1%. The percentage of small holdings has been falling since 1971-72. At the other end, one witnesses a great crowding of holdings into the "marginal" category. The percentage of holdings in this category has swelled from 40% in 1960-61 to 63% in 1991-92.

Table 3.3
Changes in the size distribution of operational holdings

INDIA	Rural			
	percentage distribution of operational holdings			
	60-61 (17th)	70-71 (26th)	81-82 (37th)	91-92 (48th)
marginal	39.1	45.8	56.0	62.8
small	22.6	22.4	19.3	17.8
semi-medium	19.8	17.7	14.2	12.0
medium	14.0	11.1	8.6	6.1
large	4.5	3.1	1.9	1.3
all sizes	100.0	100.0	100.0	100.0

Sources of estimates of 17th, 26th & 37th rounds: NSS Report Nos. 144, 215 & 331

3.3.3 Number of operational holdings:

The pressure of growing population on the limited land base and the consequent division of holdings is clearly reflected in the changes in the absolute numbers of operational holdings in different size classes. Figure 3 shows the trends in number of operational holdings in different categories during the period 1960-61 to 1991-92. It will be noted that numbers of operational holdings in different categories are not changing at the same rate, or even in the same direction, over time. Over the three decades the number of marginal holdings has multiplied from 19.8 million in 1960-61 to 58.7 million in 1991-92 -- a threefold increase. The number of small holdings, too, has been increasing,

though at a moderate rate since 1970-71. As against this, the absolute numbers of large and medium holdings have declined steadily during this period. What is interesting to note is that the number of semi-medium holdings, appears to be on the increase after remaining stable at 10 million from 1960-61 to 1981-82.

3.3.4 *Distribution of operated area* : Table 3.4 gives percentage distributions of operated area by category of operational holdings from the last four

Table 3.4
Changes in percentage distribution of operated area by category of operational holdings

INDIA	Rural			
	percentage distribution of operated area			
	60-61 (17th)	70-71 (26th)	81-82 (37th)	91-92 (48th)

Table 3.6
Trend in concentration of operated area

INDIA group of operational holdings	Rural percentage share in operated area			
	61-62 (17th)	71-72 (26th)	81-82 (37th)	91-92 (48th)
bottom 30%	4.6	4.4	2.2	3.0
bottom 60%	18.3	18.6	14.9	14.2
top 10%	46.0	45.0	47.2	47.6
top 5%	30.5	30.6	32.4	33.6

Sources of estimates of 17th, 26th & 37th rounds : NSS Report Nos. 144, 215 & 331

operated area has increased from 7% in 1960-61 to 16% in 1991-92. The share of small holdings has also registered growth, though at a slower pace, and there is some growth in the share of semi-medium holdings as well. At the other end, one sees a significant decline in the share of large holdings -- from 29% in 1970-71 to 15% in 1991-92.

3.3.5 *Unchanging nature of size distribution* : Table 3.5 presents the cumulative percentage distribution of operational holdings and area operated by size class from the last four Land Holding Surveys of NSS. The data are presented for the 12 size classes which could be formed maintaining comparability of the results of the four surveys. The Gini's coefficients given in Table 3.7 are based on these 12 size classes. It is seen from Table 3.5 that the nature of size distribution of operational holdings has, by and large, remained unchanged over the three decades, notwithstanding

the progressively downward shift in the distribution.

3.3.6 *Lorenz curve* : Table 3.6 shows, separately for the four surveys, selected ordinates of the Lorenz curve, i.e. cumulative percentage share in aggregate operated area of selected ordinal groups of operational holdings. The values of the ordinates presented in the Table 3.were read from the smoothened versions of Lorenz curves based on actual estimates.

Table 3.7
Trend in Gini's coefficient

INDIA year	Rural Gini's coefficient ²	
	operational holdings	ownership holdings
1960-61	0.583	0.731
1970-71	0.586	0.709
1981-82	0.629	0.712
1991-92	0.641	0.710

Sources of estimates of
17th round: NSS Report No.144
26th round: NSS Report Nos. 144 & 215
37th round: NSS Report Nos. 330 & 331
Gini's Coefficient for ownership holdings for 1991-92 is taken from NSS Report No.309

3.3.7 *Growing inequality* : Table 3.6² reveals that the share of the bottom 60% of the operational holdings in the total operated area has progressively declined

² Gini's coefficient

$$C = 1 - [\sum(P_j - P_{j-1})(q_j + q_{j-1})]/10^4$$
 where P_j and q_j area respectively the cumulative percentage of number of operational holdings and area operated in the j^{th} size class of holdings.

Sources of estimates of 26th and 37th rounds : NSS Report Nos. 215 & 331

over the three decades. As against this, the shares of both the top 10% and 5% groups of holdings have grown, though at a low rate, during this period. The present survey shows that overall decline between 1960-61 and 1991-92 in the share of the bottom 60% is about 4 percentage points, a great deal of which is accounted by the rise (3 percentage points) in the share of the top 5% over the same period. Thus it is seen that the inequality in the distribution of operational holdings, high as it is, has been increasing during the last three decades.

3.3.8 *Gini's coefficient - a measure of inequality* : To serve as an overall measure of inequality in the size distribution of operational holdings, the Gini's coefficient has been worked out for 1960-61, 1970-71, 1981-82 and 1991-92, and is presented in Table 3.7. The trend in Gini's coefficient confirms that the inequality in operational holdings has been increasing progressively since 1960-61. The table also provides Gini's coefficient of household ownership holdings. It is seen that, during the last two decades, while the concentration ratio of ownership of land remained by and large unchanged, that of operational holdings rose sharply from 0.586 in 1970-71 to 0.641 in 1991-92, a fact that is entirely consistent with the phenomenon (discussed later in section 3.7 of this chapter) of an increasing tendency of large and semi-medium holdings to lease in land from the marginal and small ones.³

3.4 Changes in size distribution: inter-state comparison

3.4.1 Table 3.8 gives the percentage distributions of operational holdings and percentage of area operated in different categories of holding in 15 major states for 1991-92, 1981-82 and 1970-71, as obtained from the Land Holding Surveys of NSS 48th, 37th and 26th rounds respectively. The general feature emerging from the table is that the distribution of operational holdings continued to be highly unequal in all the major states.

3.4.2 In all the major states, the pressure of population growth on the limited land base is reflected in the progressive downward shift in the distribution of operational holdings over the two decades. It is observed that, in general, there was a rise in the percentage of marginal holdings and a decline in percentage of holdings in the semi-medium category upwards. Only in respect of small holdings could some amount of inter-state variation, both in magnitude and direction, be observed during the period. Contrary to the general declining trend, the percentage of small holders in Madhya Pradesh underwent a steady rise since 1970-71. In Punjab and Haryana, too, the proportion of small holders registered a rise during the eighties, after having declined sharply in the preceding decade.

³ See Bibliographical Note 2

TAMIL NADU	0.516	0.640	0.646	0.71
UTTAR PR.	0.495	0.565	0.572	1.01
WEST BENGAL	0.490	0.597	0.585	0.60
INDIA	0.586	0.629	0.641	1.34

Note : The concentration ratios for 1970-71 and 1981-82 are taken from "Temporal and regional variations in the agrarian structure in India", by T.Haque, *Indian Journal of Agricultural Economics*, July-Sept. 1987, Vol.42, NO.3CN

3.4.3 *Gini's coefficient* : The values of *Gini's coefficient* given in Table 3.9 for the years 1970-71, 1981-81 and 1991-92 indicate the changes in the level of inequality in the size distribution of operational holdings in the 15 major states. As stated earlier, the Gini's coefficient of operational holdings in the country as a whole has increased significantly during the period. Over the states, however, the ratio has shown varying trends.

3.4.4 In 10 of the 15 major states there has been an upward trend in the concentration ratio since 1970-71. The rise was most pronounced for the two most agriculturally developed states of Punjab and Haryana. In Punjab, the ratio increased sharply from 0.418 in 1970-71 to 0.702 in 1981-82. This was followed by a small rise in the next decade. In the case of Haryana, the ratio rose substantially in both the decades. The overall increase from 1970-71 to 1991-92 was from 0.464 to 0.675. It may be noted that the Gini's coefficient in these two states were much higher than the national ratio of 0.641 in 1991-92.

3.4.5 In Assam, Kerala, Orissa and West Bengal, the Gini's coefficient increased during 1970-71 to 1981-82, but it has shown a marginal decline in the following decade. In the cases of Assam and West Bengal, there was a substantial rise during the seventies. The only major state not registering a rise in the Gini's coefficient during either of the decades was Andhra Pradesh.

EXTENT OF TENANCY

3.5.1 The changes under way in the tenancy status of operational holdings are briefly discussed in paragraphs 3.2.8 and 3.2.9. This section deals with the trends in incidence of tenancy and proportion of tenanted land under major terms of lease *vis-à-vis* size class of holdings.

Table 3.10
A few important indicators of land tenure status in 1991-92

INDIA		Rural
item	estimate	
1. no. of tenant holdings (mill.)	10.27	(10.99%)
2. total operated area leased in (mha.)	10.36	(8.28%)
3. area leased in per tenant holding (ha.)	1.01	
4. no. of holdings with otherwise possessed land (mill.)	3.87	(4.14%)
5. total otherwise possessed operated area (mha.)	1.26	(1.01%)
6. otherwise possessed area per holding with otherwise possessed land (ha.)	0.33	

Note:(i) "tenant holding" stands for operational holding with wholly or partly leased-in area.

(ii) figures in parentheses indicate the percentages to number of holdings or total operated area.

3.5.2 Granting of the right to use a piece of land to others, either on rent or free, by the owner without transferring the title is termed *land lease*. Agreements of such lease, even when made orally, are considered as lease contracts in the Land Holding Survey of NSSO. On the other hand, hereditary tenancy and long term lease for 30 years or more are not treated as land lease -- they are treated as land ownership. But possession of encroached private land is treated as leased-in land (free of rent).

3.5.3 *National level estimates*: Table 3.10 gives the estimates of the present survey indicating extent of tenancy in

rural India. The number of tenant holdings, i.e. holdings with wholly or partly leased-in land, was about 10 million, reporting an area of about 10 million hectares of tenanted land. Thus, on an average, a tenant holding had a hectare of leased-in land in its possession during 1991-92.

3.5.4 Table 3.10 also provides estimates of "otherwise possessed" land, i.e. possession of public or institutional land without title of ownership or occupancy right. About 4 million holdings reported possession of such land, its area amounting to about a million and a quarter hectares.

3.6 Tenancy and size of holding

3.6.1 Though the measures of land reform undertaken since Independence appear to have deterred the growth of exploitative tenancy, there is still a high proportion of tenanted land in total operated area. What is most remarkable about tenancy in rural India is the significantly high proportion of total tenanted land operated by a small proportion of holdings.

3.6.2 Table 3.11 shows the incidence of tenancy by broad size class of operational holdings in 1991-92. The percentage of tenant holdings shows, largely, a rising tendency with the holding size. In the lowest class -- i.e. holdings below 0.20 hectares constituting 28% of the operational holdings -- the percentage is much smaller than in the rest of the classes.

Table 3.11
Percentage of tenant holdings and area leased in by broad size-class in 1991-92

INDIA			Rural
broad size class (ha.)	% of tenant holdings	% of area leased in	% dist. of area leased in
less than 0.20	6.4	6.98	1.0
0.21 - 0.50	11.6	9.04	4.7
0.51 - 1.00	12.4	8.70	10.6
marginal	9.3	8.7	16.3
small	14.9	8.53	19.3
semi-medium	12.2	7.41	21.6
medium	13.1	6.90	22.0
large	16.7	11.37	20.9
over 1.00	13.8	8.2	83.7
all sizes	11.0	8.28	100.0

The next column of Table 3.11 shows that the percentage of tenanted land (area leased-in) in operated area, on the other hand, falls as one passes from size class 0.21-0.50 to size class 4.01-10.00. But, in the topmost size class (over 10.00 ha.) it is significantly higher (11.4%) than in the rest of the classes.

3.6.3 Share in tenanted land by holding size: The percentage distribution of tenanted land by the size class of holdings is shown in the last column of Table 3.11. It is seen that nearly two-thirds of the total tenanted land was operated by the top 3 classes, which constituted only about 19% (see Table 3.5) of the total operational holdings. If one considers that holdings higher than one hectare i.e., the top 4 classes, one

sees that as much as 85% of the total tenanted land is operated by these holdings, which, from Table 3.5 are found to constitute about 37% of the total number of operational holdings. Since around 14% of the holdings in the size classes larger than 1 hectare were tenant holdings, it follows that about 84% of the total tenanted land was operated by only 5% of the total number of operational holdings.

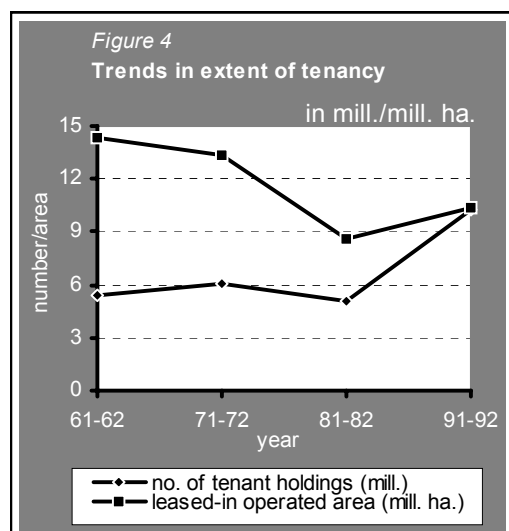

3.7 Trends in extent of tenancy

3.7.1 One of the most interesting possibilities brought to light by the present survey is that of a change in trend in extent of tenancy. Two mutually reinforcing findings presented in Figure 4 points to this possibility. One, the

Table 3.12
Percentage of tenant holdings by categories of operational holdings, 1960-61 to 1991-92

INDIA		Rural			
categories	percentage of tenant holdings				
	60-61 (17th)	70-71 (26th)	81-82 (37th)	91-92 (48th)	
marginal	24.1	27.0	14.4	9.3	
small	25.1	27.8	17.9	14.9	
semi-medium	23.6	24.8	15.9	12.2	
medium	20.5	20.0	14.5	13.1	
large	19.5	15.9	11.5	16.7	
all categories	23.5	25.7	15.2	11.0	

Sources of estimates of 17th, 26th & 37th rounds: NSS Report Nos. 144, 215 & 331

number of tenant holdings, which remained more or less stable around five and a half million during 1960-61 to 1981-82, increased sharply to about 12 million during the last decade. Two, the total leased-in operated area, after exhibiting a clear downward trend during 1960-61 to 1981-82, showed an upturn after 1981-82.⁴

3.7.2 Rise in incidence of tenancy in higher size classes: The percentages of tenant holdings by category of holdings from the four LHS of NSSO are given in Table 3.12. The percentage of tenant holdings in the marginal, small and semi-medium categories, in each decade, moved in the same direction as the all-categories percentage. The percentage for the medium and large holdings, on the other hand, declined continuously from 1960-61 to 1981-82. Then, during the last decade, the percentage of tenant holdings increased remarkably among the large holdings and at a moderate rate in the medium class; but the percentage

for all operational holdings continued to fall.

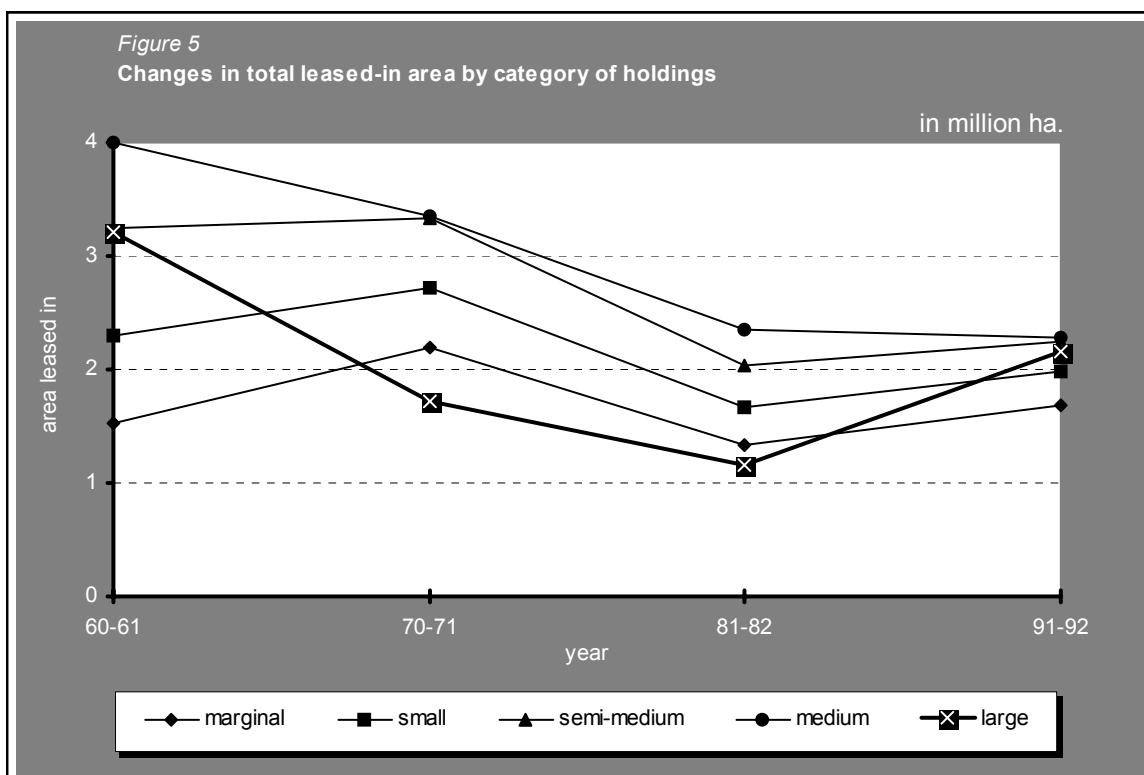

3.7.3 Rise in area under tenancy in higher size class: Table 3.13 shows the percentage of leased-in area by category of holdings size class from the four LHS's. Till 1981-82, there was a steady decline in the percentage of tenanted area in all the size classes. But after 1981-82, one observes that the fall continues only for the "marginal" category, and, simultaneously, that the percentage for large holdings rises sharply -- in fact, doubles. This rise in the "large" category not only arrested the fall in the overall percentage but also raised it from 7% to 8% during the decade. Meanwhile, the inverse relationship, which had prevailed between the size of holding and percentage of leased-in area for two decades since 1960-61, seems to have

Table 3.13
Change in percentage of area leased in
by category of operational holdings

INDIA category	Rural percentage of area leased in			
	60-62 (17th)	70-71 (26th)	81-82 (37th)	91-92 (48th)
marginal	16.6	18.9	9.7	8.7
small	14.0	14.6	8.5	8.5
semi-medium	11.7	11.7	7.3	7.4

rounds: NSS Report Nos. 144, 215 & 331

⁴ See Bibliographical Note 3

disappeared with the large holdings reporting the highest proportion (11%) of leased-in operated area 1991-92.

3.7.4 Trends in total leased-in area:

The tenancy legislation enacted in the late fifties and early sixties had set off a declining trend in tenancy of land. The large and medium holdings were the most affected ones -- there was a sharp decline in the total leased-in area in both the classes during the following decade (Figure 5). In all the lower size classes, however, the total leased-in area increased perceptibly during this period. With the enforcement of more restrictive tenancy legislation in late sixties and early seventies, the total leased-in area declined in all the size classes, almost at the same rate, during the next decade. But the results of the present survey

show a sharp rise⁵ in the total leased-in area in the large holdings, accompanied by moderate increase or little change in the other size classes.

3.8 Extent of tenancy : inter-state comparison

3.8.1 Table 3.14 provides the survey estimates of percentage of tenant holdings and percentage share of tenanted land in operated area for 15 major states. The corresponding estimates of the LHS, 37th round (1981-82) are also given in the table for examining the emerging trends in tenancy in these states.

⁵ See Bibliographical Note 4

3.8.2 It is seen that the percentage of leased-in area was the highest among the 15 states in Haryana (34%) in 1991-92. Punjab too reported a high percentage (19%) of tenanted land. In 1981-82 as well, the highest two percentages of

both tenant holdings and leased-in area in these two states. On the other hand, both the percentages rose perceptibly in Andhra Pradesh and Madhya Pradesh.

3.9 Terms of lease

3.9.1 Leasing of land is contracted by two parties under certain terms of lease that are binding on both parties. In the present survey, data were collected for the following specific terms of lease:

- (i) for fixed money,
- (ii) for fixed produce,
- (iii) for share of produce,
- (iv) for service contract,
- (v) for share of produce together with other terms,
- (vi) under usufructuary mortgage,
- (vii) from relatives under no specified terms.⁶

3.9.2 Table 3.15 gives the percentage distribution of leased-in area by the four major terms of lease and the rest put together under "other terms". Share cropping (34%) was found to be the most prevalent practice of leasing land followed by fixed rent, in cash or kind (33%). A substantial proportion (7%) of the leased-in area was found to have been taken from relatives under no specified terms. It may be noted that the data on leasing in from relatives under no specified terms were collected for the first time in the present survey.

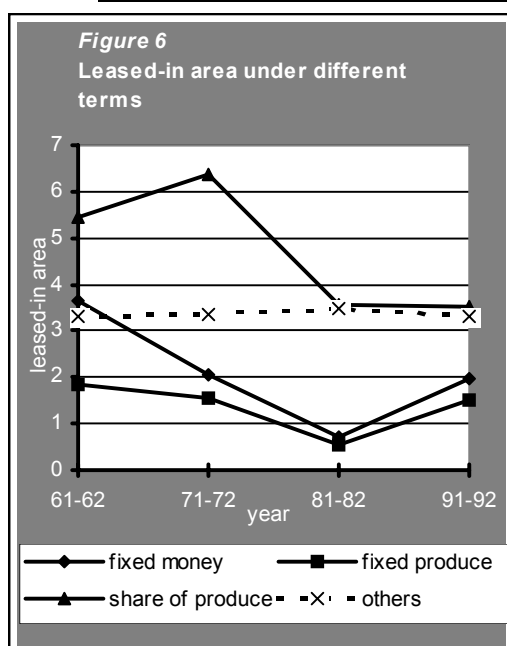

Table 3.14
Percentage of tenant holdings and operated area leased in for 15 major states

STATE	% of tenant holdings		Rural % share of leased in area

INDIA	15.2	11.0	7.2	8.3

tenanted land were observed in Haryana (18%) and Punjab (16%).

3.8.3 For the country as a whole, though the proportion of tenant holdings declined, the share of leased-in area increased during the last decade. While most of the major states conformed to this pattern, a few deviated from it. Among the notable exceptions are West Bengal and Bihar. There was a substantial decline in the percentages of

⁶ The detailed results, given in table 5R of the Appendix, pertain to percentage of holdings reporting leasing in of land under different terms of lease.

Leased-in area by terms of lease for

19.0	5.3	29.1	100.0
34.4	7.4	24.7	100.0

3.9.3 Terms of lease and size of holding:

The survey estimates reveal, on the whole, a positive relationship between size of holding and percentage of leased-in area under the "fixed money" term but a negative relationship with "share cropping". The two lowest size-classes, however, do not conform to this pattern. In the case of "fixed produce", the percentage increased with increase in size of holding up to "small" holdings category (1.01-2.00 ha.), but declined thereafter. What is clearly revealed by the estimates is the negative association between the size of holding and the percentage of leased-in area taken from relatives under no specified terms, but for a nominal deviation in the topmost class.

Table 3.16
Percentage distribution of leased-in area by terms of lease

INDIA	Rural			
	percentage distribution of leased-in area

4. others	23.3	25.1	40.9	32.1
5. all terms	100.0	100.0	100.0	100.0

Sources of estimates of 17th, 26th & 37th rounds: NSS Report Nos. 144, 215 & 331. Figures in parenthesis are the percentage of tenant holdings reporting leased-in area under the terms of lease.

3.9.4 *Rise in share of "fixed rent" in tenanted land:* The percentage distributions of leased-in area by terms of lease from the four LHS's of NSSO are given in Table 3.16. A significant feature of this time series is a clear change in trend in the share of the two "fixed rent" (rows 1 & 2) tenancies, separately or taken together. The share of area leased-in on fixed money or fixed produce had declined steadily during 1960-61 to 1981-82. There was also a decline in the total area leased in under both the terms (Figure 6). By 1981-82, the combined shares of the two "fixed rent" terms had come down to a meagre 17% of the total leased-in area. But since 1981-82, the situation appears to

have undergone a remarkable change. There was a significant rise, both in the percentage share and total leased-in area, in tenancy under both the "fixed rent" terms.⁷

3.9.5 *Change in prevalence of share cropping:* Share cropping continues to be the most important form of tenancy in the country (Table 3.16). The land reform legislations enacted during the late fifties and early sixties permitted resumption of personal cultivation by the owner of land leased out under share cropping contracts, while framing the laws preventing eviction of tenants. As a result, total area leased in under share cropping contracts rose appreciably during the sixties, while the area under "fixed rent" tenancies dropped significantly (Figure 6). The revised tenancy acts of the late sixties and early seventies, which clearly distinguished share cropping from personal cultivation,⁸ brought about a rapid decline in area under share cropping tenancy from over 6 million hectares in 1970-71 to 3.5 million hectares in 1981-82. It has remained stable at 3.5 million hectares since then.

3.9.6 *Inter-state variation in leasing under different terms:* The percentage distribution of leased-in area operated under four specific terms of lease and the rest put together in "other terms" is given for 15 major states in Table 3.17. The distributions for the individual states

reveal a wide variation over the country in the relative importance of different contracts.

3.9.7 In Haryana and Punjab -- the two most agriculturally advanced states in the country -- the most prevalent form of contract was fixed rent in cash. Over 61% and 49% of the tenanted land was contracted for fixed money in Haryana and Punjab respectively. In Tamil Nadu and Andhra Pradesh, too, "fixed rent" tenancies were the major component of leased-in area. The combined shares of "fixed money" and "fixed produce" in total leased-in area was about 53%.

3.9.8 Share cropping was found to be the most prevalent form of tenancy in Orissa (51%), West Bengal (46%), Uttar Pradesh (46%) and Bihar (44%).

3.9.9 While "share cropping" and "fixed rent" tenancies were the main terms of lease in most of the states, leasing in "from relatives under no specific terms" was predominant in Kerala. Land so possessed accounted for 39% of the leased-in land in the state.

3.9.10 *Change during the eighties:* Table 3.17 also gives the percentage distribution of tenanted land by terms of lease for 1981-82. It is to be noted that leasing in from relatives under no specified terms was not collected separately in the 37th round LHS. Thus such leasing of land is included in "other terms" in the distribution for 1981-82. It is seen that most of the major states exhibited a shift in importance from "share cropping" to tenancy under "fixed" terms. The notable among them are Bihar, Haryana, Maharashtra, Punjab

and Tamil Nadu. In all these states, the percentage share of "share cropping" declined substantially, while those of the "fixed" terms rose appreciably during the eighties. In Andhra Pradesh, Gujarat, Kerala, Orissa and Rajasthan as well there was a considerable change in the distribution of tenanted land by terms of lease. The shares of all the three major terms of lease, viz. "fixed money", "fixed produce" and "share of produce", rose perceptibly at the cost of the share of "other terms" in all these states during the decade.

USES OF OPERATIONAL HOLDINGS

3.10.1 The following discussion deals with the different uses of the operational holdings, in terms of land use, major agricultural activity and other agricultural activities of the holdings. The main survey findings on irrigation of land are also presented here.

3.11 Land use in operational holdings

3.11.1 Information on land use for each of the plots included in the surveyed operational holdings was collected in the survey with the whole agricultural year as the reference period. The standard ninefold classification of land use was modified appropriately to suit the purpose of the survey. The detailed percentage distributions of operated area

by land use are given in Table (8R) of the Appendix, separately for each of the seven broad size classes of operational holdings. Data were collected on operated area and the break-up over the following nine types of land use (definitions are given in Chapter 1):

- (i) net area sown :
 - (a) unirrigated & cropped once
 - (b) unirrigated & cropped more than once
 - (c) irrigated & cropped once
 - (d) irrigated & cropped twice
 - (e) irrigated & cropped more than twice
- (ii) current fallow
- (iii) other fallow
- (iv) water bodies and

- (v) other uses.

3.11.2 For the discussion in this chapter, the estimates for the three main types of land, viz. 'net sown area', 'current fallow' and 'other fallow' are examined separately, while those for other uses are clubbed into one group called 'other uses'. The percentages of operated land under these four types of land use are given in Table 3.18 for the 17th (1960-61), 37th (1981-82) and the 48th rounds. It may be mentioned here that estimates of land use are not available from the LHS of the 26th round.

3.11.3 The estimates of the LHS reveal little change in the pattern of land use over the period. However, they depict a moderately rising trend in the percentage of net sown area in the total operated area, at the cost of the shares of other uses of land.

Table 3.18
Percentage distribution of area operated by type of land use: 1960-61, 1981-82 and 1991-92

INDIA land use	RURAL		
	% of area operated		
	1960-61	1981-82	1991-92
net sown area	85.9	88.0	93.1
current fallow	2.6	2.8	1.5
other fallow	1.7	1.4	0.5
other use	9.8	7.8	4.9
all	100.0	100.0	100.0

Note: The estimates for 1991-92 presented in the table are calculated on the basis of reported land use only, and thus differ from the estimates of Table(8R) in the Appendix, which gives the estimates of the not reported part separately.

3.12 Main use of operational holdings

3.12.1 The operational holdings were classified according to the main agricultural activity pursued in them during the agricultural year 1991-92. Among different agricultural activities, the activity generating the maximum income was considered as the main use of the holding. The list of agricultural activities used for this purpose was :

- (i) crop production:
 - (a) vegetables
 - (b) other than vegetables
- (ii) production from horticulture and orchards
- (iii) production from plantation:

- (a) forestry
- (b) others
- (iv) livestock
- (v) poultry
- (vi) pisciculture
- (vii) others.

3.12.2 The distribution of holdings by the detailed main-use classification is given in Tables(10R) & (10U) of the Appendix. For the purpose of the present discussion, percentage of holdings falling in certain main use classes have been merged together and shown under the broader class so formed. The details of formation of the broader classes are given below:

broad class	constituent detailed classes
1. crop production	(i) vegetables (ii) other than vegetable
2. plantation & orchards	production from horticulture crops/ orchards (from both forestry & others)
3. livestock	livestock
4. poultry	poultry
5. others	(i) pisciculture (ii) others

3.12.3 Table 3.19 gives the percentage distribution of operational holdings by their main use for 1991-92 and 1981-82. It is seen that, at the national level, about 80% of the operational holdings were mainly used for crop production in

1991-92. The major income of another 4% was from plantation and orchards. These two together are shown under "crop production" for 1981-82, when information was not collected separately for the two uses. The next important activity was rearing of livestock and poultry -- about 10% of the operational holdings reported it as the main use.

3.12.4 *Inter-state variation in main use:* Generally speaking, crop production was the predominant "main use" of operational holdings in most of the major states. The notable exceptions, in this regard, were Punjab, Haryana and Kerala. The main use of 42% of the holdings in Punjab was livestock rearing, while the national level estimate was only 8%. Haryana too had a substantial proportion (23%) of holdings with livestock rearing as its main use. Lastly, while only 4% of the operational holdings in rural India reported "plantation & orchards" as their main use, a majority of the holdings (59%) in Kerala were operated mainly for production from plantations.

3.12.5 The estimates for 1981-82, which are based on the 37th round LHS, are given in the table only for reference, as their use for studying the change during the decade could be very misleading. In the 37th round, data were collected separately for the seasons and estimates were generated for the major crop season. Since the estimates from the present survey are based on the entire agricultural year under reference, the two sets of estimates are not strictly comparable.

Table 3.20

3.13 Types of agricultural production

3.13.1 Besides the main activity, a number of other activities are simultaneously carried out on most of the holdings. In an attempt to understand the nature and scale of agricultural operations, the holdings were classified into certain exclusive groups on the basis of the agricultural activities carried out in them. Those reporting agricultural

production, presumably on a small scale, in the homestead alone were first identified. They were then further classified by the types of agricultural production they had undertaken during the reference agricultural year. The rest of the holdings were primarily classified into two groups -- those reporting raising of field crops and the rest.

3.13.2 It was found that holdings which carried out agricultural production

outside the homestead almost invariably reported raising of some field crop during the reference agricultural year. This explains why the percentages for “all agricultural production within homestead” and “crop production outside homestead” in each row of Table 3.20 (as well as Tables (10R) & (10U) of the Appendix) add up to 100 even though, among the different kinds of agricultural production undertaken outside the homestead, only “raising of field crops” has been considered.

3.13.3 At the national level, over 76% of the holdings reported raising of field crops during the year. Of the remaining 24% of the holdings reporting agricultural production only in homestead, about one-third were exclusively engaged in rearing of livestock, with or without poultry-raising activity.

3.13.4 *Inter-state variation:* As in case of the national-level estimates, the percentage of holdings reporting raising of field crops outside homestead was, in general, high in most of the states. Kerala, however, stands out as a notable exception. In this state, only 27% of the holdings reported raising of field crops outside homestead. In Punjab, Assam and Haryana too the proportion of holdings raising field crops outside homestead was relatively low. Substantially large proportions of holdings in Punjab(31%) and Haryana(21%) were solely engaged in livestock rearing (with or without poultry raising).⁹

3.14 Use of irrigation and its sources

3.14.1 Table 3.21 gives the percentage of net irrigated area to operated area for the broad size classes of operational holdings from the present survey as well as from the 37th round LHS. The estimates of the 37th round are presented here only as a reference, as the estimates are not comparable. Data on irrigated area, too, were collected with season as the reference period, and the estimates were generated for the major crop season. The estimates of the present round are, on the other hand, based on the entire agricultural year under reference.

Table 3.21
Percentage of net irrigated area by broad size class of operational holdings : 1991-92 & 1981-82

broad size class of operational holdings (ha.)	Rural	
	% of irrigated area	
	1981-82	1991-92
0.002 - 0.20	28.7	33.7
0.21 - 0.50	36.2	43.4
0.51 - 1.00	32.9	41.7
1.01 - 2.00	30.7	38.9
2.01 - 4.00	26.6	36.8
4.01 - 10.00	33.0	32.1
10.01 & above	12.9	28.1
all sizes	24.8	35.4

⁹ See Bibliographical Note 7

3.14.2 The estimates of percentage of irrigated area obtained from the present survey suggest that there is an inverse association, though weak, between the intensity of use of irrigation and the size of holding. Leaving aside the lowest size class, it is seen that the percentage of irrigated area decreases with the increase in the size of holding -- from 43% in the 0.21- 0.50 size class to 28% in the highest size class.

3.14.3 The survey estimates of the proportion of irrigated operated area and its distribution by sources are given in Table 3.22. It is seen that 35% of the operated area in the country was irrigated during the agricultural year 1991-92. Judging by their shares in the total irrigated area, tubewells (36%) and canals (26%) were the two most important sources of irrigation at the national level.

3.14.4 *Inter-state variation in use of irrigation:* Punjab and Haryana were the

two most irrigated major states of the country. Both in Punjab and Haryana, 73% of the operated area was irrigated during 1991-92. A high proportion (67%) of irrigated operated area was reported in Uttar Pradesh as well. In sharp contrast, only 6% of the operated area in Assam was irrigated during the year.

3.14.5 *Inter-state variation in sources of irrigation:* In all the three most irrigated states, tubewell was reported as the main source of irrigation for a major part of the irrigated area. In Punjab and Uttar Pradesh, tubewells, were the principal source for as high as 83% and 67% of the irrigated area respectively. Besides the tubewell, canal too was an equally important source of irrigation in Haryana. These two sources accounted for almost 90% of the irrigated area in the three states. Among other sources, wells covered substantial parts of irrigated area in Maharashtra (55%), Gujarat(45%) and Tamil Nadu(41%).

Bibliographical Note

1. For definitions of operational holding used in earlier Land Holdings Surveys(LHS) of NSSO, see NSS Reports No. 144 (GOI 1968), 215 (GOI 1975) and 331 (GOI 1987). A comprehensive discussion on the definitions used in different LHSs is available in Sawant (1990).

2. The Working Group on Land Reforms for the Eighth Five Year Plan (GOI 1989a) observed “a trend towards concentration of land holdings through leasing of land by small holders to big ones in green revolution areas and also in places where commercialisation of agriculture has taken place on a large scale.” The Working Group also predicted that this trend would increase further. The results of the present survey strengthen the view held by the Working Group.

3. The observed rise in leased-in area during the 1980s partially owes to the reference period used in the 37th round (1982). The use of ‘major crop season’ as the reference period might have caused a smaller estimate of leased-in area in the 37th round. Bhaumik (1993) observed that leases were being contracted for just one crop in Midnapur district of West Bengal during the agricultural year 1986-87. The present survey also reveals presence of seasonal leasing. In 1991-92, about 19% and 3% of the leased-in area of the rural operational holdings were contracted only for *kharif* and *rabi*

seasons respectively. See NSS Report No. 414 (GOI, forthcoming).

The results of the present survey, however, point to the possibility of actual rise in leased-in area during the 1980s. Ghosh (1981) in his study of two agriculturally developed villages of West Bengal had observed a substantial rise in tenancy between 1965-66 and 1975-76 with increasing use of the new technology. Two recent studies (Singh 1989, and Saleth 1995) have observed more (new) tenants in relatively developed regions. Nadkarni(1976), Chatha, Singh and Grewal(1986), Murthy(1987) and Singh(1989) have noted various reasons for extensive prevalence of tenancy, like (i) smallness of plots, (ii) holders with alternative employment outside agriculture do not break away from land even if they are working elsewhere, (iii) cultivation on very small holdings not profitable. These observations also point to the possibility that, driven by the rapid population growth and diversification in non-farm employment opportunities, leasing of land is on the rise.

4. The possibility has been noted in a number of studies since early 1970s. In the Seminar on Land Reforms organised by the Planning Commission in 1989, it was noted that “a phenomenon of small and marginal farmers leasing out land to bigger landlords had been observed, especially in agriculturally developed areas”(GOI 1989b). In a number of studies published in the 1970s

(Vyas1970, Rao1974, Bharadwaj and Das 1975, Bandyopadhyay 1975, Bardhan 1976), it was observed that the tenants did not necessarily constitute the weaker party. The landed farmers with tractors and pumps leased in land to augment their farm size further from the owners of holdings for whom self-cultivation was not a profitable proposition. Some of the latter studies, like A.K.Singh (in Haque and Parthasarathi,1992), Chatha, Singh and Grewal(1986), Singh(1989), have also observed this phenomenon in agriculturally developed regions. Roa(1992) argues (citing the example of Punjab) that the evidences of reverse tenancy (leasing of land by small holders to big ones) in agriculturally developed areas points to the possibility of rise in large tenant holdings in the future.

5. The fixed rent tenancy is expected to have higher shares with the spread of advanced agricultural practices. In some of the recent studies involving comparison between agriculturally developed and backward areas, like Singh(1989) and Bhaumik(1993), the fixed rent tenancy was found to have a higher share in the developed regions.

6. Joshi(1971) and P.S. Appu ("Tenancy Reform in India" in GOI, 1989b) have reviewed the policy, legislation and implementation of land reforms in different states. Joshi has also examined the observed and possible effects of the reforms on the structure of land holdings.

7. This is consistent with the estimates of livestock holdings based on the present survey. In Punjab and Haryana, the estimates of adult female bovine stock (used mostly as dairy animals) owned per 100 rural households are

much higher than the national average. The estimated number of cattle and buffaloes per 100 rural households for the two states and India are given in the table below. These are taken from NSS Report No. 408 (forthcoming).

Number of cattle and buffaloe per 100 rural households

states	cattle		buffalo		bovine	
	a.f.	all	a.f.	all	a.f.	all
Haryana	38	101	136	229	174	330
Punjab	33	83	124	203	157	286
India	45	145	33	59	78	204

'a.f.' stands for 'adult female'
